

The FVRCP Vaccine.

- Prevents against:
 - **FVR - Feline Viral Rhinotracheitis:** A respiratory disease caused by herpesvirus-1 affecting the nose and trachea (wind-pipe). Symptoms include, sneezing, runny eyes and nose, and fever.
 - **C - Calici Virus:** An upper respiratory disease that can survive long periods of time outside the body and is resistant to many disinfectants.
 - **P - Panleukopenia:** A highly contagious disease leading to a decrease in white blood cells. It can survive for up to a year at room temperature in a given environment and is resistant to many disinfectants. Symptoms include: fever, vomiting, diarrhea, immune system deficiencies, neurologic signs, and death.
- Where we give the vaccine: Scruff area between the shoulder blades.
- What to expect: It is uncommon, however soreness or mild swelling at the injection site can occur. Lethargy for the first 24 hours after vaccination is common and not worrisome.
- Vaccine reactions to call us about: Also uncommon, but we'd like to see you and your cat back right away if you see any of the following within the first 24 hours of vaccination:
 - Facial swelling/Hives
 - Large swelling at injection site
 - Fever or lack of appetite
 - Vomiting/diarrhea

This is a core vaccine. We vaccinate for these diseases because the benefit of this vaccination largely outweighs the risk of a severe vaccine reaction.
